Web-Based Project Collaboration

New Jersey
(2003 - ongoing)

Collaborator: Rutgers University

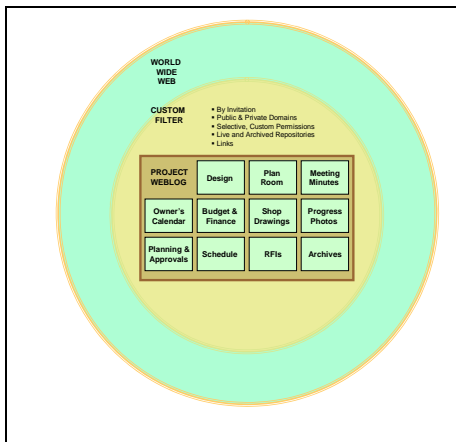

This project was selected for presentation at the 2005 A/E/C "Innovation in Architecture, Engineering, and Construction" Conference.

Summary of Project:

JS&A, with Rutgers University, has designed an implemented a cutting edge "collaboration" management tool for the construction of one of the largest new school projects in the NY/NJ region.

The new Franklin High School construction "weblog" provides a forum for dialogue as well as a repository for project information. With secure and selective access, participants to the weblog include the Owner, the A/E Design Team, the Construction Manager and the Contractors.

There are few barriers to the project team participants. The development of the weblog structure on a real-life, major construction project has brought everyday usage, critique, and testing to the weblog concept.
